TI Cosmetic compositions containing salts of malonic acid

AB A cosmetic composition is provided which includes as an active material about 0.0001 to 30% by weight of a salt of malonic acid in a cosmetically acceptable carrier, wherein the composition exhibits a flexibility value greater than 1 according to the porcine skin test. For example, a powdered cosmetic composition contained Polysilicone 11 27.5%, cyclomethicone 54%, petrolatum 11%, tris(hydroxymethyl)methane ammonium malonate 7%, and dimethicone copolyol 0.5%.

TI	Cosmetic compositions with ammonium malonates			
AB	A cosmetic composition having a pH from 1.8 to 6.5 is provided, comprising as an active material 0.0001% to 30% by weight of a salt formed from neutralization of malonic acid with ammonia or a C1-10 hydrocarbyl amine. Particularly preferred is ammonium malonate. Thus, a clin. study showed that a cosmetic composition containing ammonium malonate was nearly as affective in improving the general condition of skin as that containing ammonium glycolate with less irritation.

- TI Sunscreen cosmetic compositions storage stabilized with malonate salts
- AB A cosmetic composition is provided which includes an organic sunscreen agent and at least one salt of a malonic acid. The malonate salt inhibits discoloration which may arise from the presence of the sunscreen agent. Of particular concern in forming color bodies is 4,4'-t-butyl-methoxydibenzoylmethane. For example, a powdered cosmetic composition with sunscreen was formulated containing Polysilicone 11 22.5%, cyclomethicone 56%, petrolatum 11%, Parsol 1789 3%, tris(hydroxymethyl)amino methane malonate 7%, and dimethicone copolyol 0.5%.

AB	An antimicrobial wipe, effective against Gram pos. bacteria, Gram neg. bacteria, fungi, yeasts, molds, and viruses, comprises a porous or absorbent sheet impregnated with an antimicrobial cleansing composition containing			

- 0.001-5.0% of an antimicrobial agent, 0.05-10% of an anionic surfactant, 0.1% -10% of a proton donating agent, and 3.00-99.85% of water. The composition is adjusted to a pH of 3.0-6.0. The antimicrobial cleansing composition has an One-wash Immediate Germ Reduction Index of > 1.3 and a Mildness Index of > 0.3. The present invention also relates to methods for removing germs from the skin using the antimicrobial wipes described herein.

DOCUMENT NUMBER: 92:52907
 TITLE: Effects of solvents and solutes on the percutaneous absorption of m-dinitrobenzene
 AUTHOR(S): Ishihara, Nobuo; Ikeda, Masayuki
 CORPORATE SOURCE: Sch. Med., Tohoku Univ., Sendai, 980, Japan
 SOURCE: International Archives of Occupational and Environmental Health (1979), 44(2), 91-8

 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB A preparation containing m-dinitrobenzene (I) [99-65-0], in which the solvent was a mixture of ethylene glycol [107-21-1] and diethylene glycol [111-46-6] and diammonium sebacate [19402-63-2] was added as a coexisting solute, did not produce methemoglobinemia either in humans or in guinea pigs when applied percutaneously. When the concentration of diethylene glycol was $\leq 15\%$ (weight/weight) and that of ethylene glycol was $\geq 77.5\%$, the solution produced methemoglobinemia in guinea pigs. Replacement of ammonium sebacate with adipic acid diammonium salt [3385-41-9] or malonic acid diammonium salt [18815-40-2] without any modification of the solvent also made the formulation capable of methHb formation in guinea pigs. All of the formulations and their modifications, regardless of their pos. or neg. capacity to produce methemoglobinemia, did not provoke skin irritation in guinea pigs. Thus, the percutaneous absorption of I is influenced by the composition of the solvent and(or) the coexisting solute.
